

**U.S. Territory of Guam
SARS-CoV-2/COVID-19 Surveillance Summary Report
March 15, 2020 to March 14, 2022.**

**OFFICE OF EPIDEMIOLOGY AND RESEARCH & COVID-19 SURVEILLANCE UNIT
GUAM DEPARTMENT OF PUBLIC HEALTH AND SOCIAL SERVICES**

3/29/2022

This graph depicts the entire pandemic on Guam from March 15, 2020 to March 14, 2022, with the cases by day in blue and by onset date in orange. The surges in cases reflect the Alpha surge (August-November 2020), the Delta surge (August-November 2021) and the Omicron surge January-March 2022).

This graph depicts the number of tests conducted through the pandemic on Guam and the SDRA (Seven Day Rolling Average) positivity rate.

This graph depicts the SDR of cases and positivity rate throughout the pandemic.

This graph depicts the 7 day average of cases by age groups through the pandemic.

This graph depicts the island-wide hospitalized and ICU COVID-19 cases. Hospitalizations and ICU cases were highest during the first (Alpha) surge, but significant during the Delta surge, and lower during the Omicron surge.

This graph depicts the cumulative number of COVID-19 cases during the pandemic and the cumulative death count.

This graph depicts the cumulative numbers of two dose (fully vaccinated) in Guam’s population (blue) and the proportion fully vaccinated (orange).

SUMMARY OF FINDINGS:

Sex:

There was an increase among female cases from 2020 to 2021 and 2022, with a corresponding decrease in cases among males.

The opposite trend is found among deaths, with males an increasing proportion of deaths from 2020 to 2021 and 2022.

Age:

For the entire pandemic total to date by age, cases were highest among those 18-39 years, followed by those aged 0-17 years and then those ages 40-59. Only 10% of COVID-19 cases are among those aged 60 and over, however, the majority (65%) of deaths occurred among those over 60 years of age.

Those over 80 years old have represented 18.6% of deaths to date. Among deaths there is a definitive increase in deaths in 2022 among those aged 80+ years (39.1%).

Ethnicity:

Chamorro cases show an increase from 2020 to 2021 and 2022, but the Chamorro proportion of deaths remained steady from 34-36%, proportionate to what is expected in Guam's population.

Filipinos had high numbers of cases initially which then dropped during 2021 and 2022. Filipino proportions of deaths increased to 37.5% in 2022, but this is only disproportionate to their population numbers in 2022.

Chuukese and other Pacific Islander cases decreased from 2020 to 2021 and 2022, as did their proportion of deaths. However, Chuukese have had overall disproportionately higher deaths (and DOAs) relative to their proportion in the population for the entire pandemic.

Chronic Conditions:

Chronic conditions among cases are low; only hypertension, and current/former smoking are apparent among cases during 2020 and 2021.

Among COVID-19 related deaths however, chronic conditions are readily apparent with hypertension and diabetes the most common, followed by cardiovascular disease, chronic renal or lung disease.

For example, the proportion of deaths with a diabetes diagnosis on the line list or PUI form was 48.4% in 2020, 35.1% in 2021 and 60.9% in 2022.

Overall, for the entire pandemic the proportion of deaths with any diagnosis of diabetes among deaths (MD notes, line list or death certificate) constitutes 53.3%.

Hypertension follows this same pattern with 56.3% in 2020, 33.8% in 2021 and 70.3% in 2022.

There is essentially no change in the analysis of causes of deaths for COVID-19 deaths from previous reports, except that 2022 saw higher proportions of among those who also had cancer listed on the death certificate (and on the line list).

Demographics on deaths (from death certificates):

There is a continued pattern of high proportions with high school or less education dying from COVID-19.

By occupation, laborers, homemakers, managers and food service workers also stand out as occupational risks.

By industry, construction, education, government, service/retail, homemaking, professional/management and food service also stand out.

Although the year 2022 is just starting, DOAs represent almost one-half (46.9%) of the deaths in 2022, whereas DOA's were only 36.4% of all deaths in 2021 and 18.23% of deaths in 2020. During the entire pandemic DOA's have averaged 32% of COVID-19 related deaths.

DETAILED SUMMARY OF FINDINGS:

DEMOGRAPHIC CHARACTERISTICS AND CHRONIC CONDITIONS AMONG COVID-19 CASES AND DEATHS BY YEAR

Table 1 (cases) and Table 2 (deaths) show the demographic characteristics of cases and deaths for the SARS-CoV-2/COVID-19 pandemic by year.

By sex and pandemic year, there is an increase among female cases from 2020 (41.7%) to 2021 (47.1%) and 2022 (50.2%), with a concomitant decrease in cases among males from 2020 (28.3%), however, the opposite trend is found among deaths, with males an increasing proportion of deaths from 2020 to 2022.

For the pandemic total to date by sex, there is almost an even split by sex among cases (male 52% and female 48%), while deaths are higher among males (58%) compared to females (42%).

By age and pandemic year, among cases there is an increasing proportion of children from 2020 to 2021 and then 2022 and a decreasing proportion among those aged 40-59.

Among deaths there is a definitive increase in deaths in 2022 among those aged 80+ years (39.1%), and a decrease among those aged 40-59 in 2022 compared to 2020 and 2021.

For the entire pandemic total to date by age, cases were highest among those 18-39 years, followed by those aged 0-17 years and then those ages 40-59. Only 10% of COVID-19 cases are among those aged 60 and over, however, the majority of deaths occurred among those over 60 years of age (65%).

In addition, Guam's population over 80 years old was estimated to be 2.2% of the population in 2020 (Guam Statistical Yearbook, 2019), but those over 80 years old have represented 18.6% of deaths to date.

By ethnicity and pandemic year, Chamorro cases show an increase from 2020 (26.9%) to 2021 (39.2%) and 2022 (36.5%), but the Chamorro proportion of deaths remained steady from 34-36%.

Filipinos had high numbers of cases initially (27.8%) which then dropped to 21.8% during 2021 and 19.9% in 2022. Filipino proportions of deaths started at 27% in 2020, decreased to 25% in 2021 and increased to 37.5% in 2022.

Chuukese and other Pacific Islander cases decreased from 2020 to 2021 and 2022, as did their proportion of deaths. However, Chuukese have represented disproportionately higher deaths than their proportion in the population. The proportions of people of unknown ethnicity increased in 2022.

For the entire pandemic total to date by ethnicity, Chamorros represent 35.6% of cases and 35.3% of deaths, and this is slightly less than their estimated proportion in Guam's population (Table 3).

Filipinos represent 21.6% of cases and 28.1% of deaths, with their cases less than what we would expect given their proportion in the population, and deaths (28.1%) similar to what we would expect, except for their higher proportions in 2022 as noted above.

Chuukese are disproportionately represented among COVID-19 deaths (22.2%) given their estimated proportion in Guam's population (7.8%). Chuukese also represent higher proportions of those DOA (data not shown here, but available upon request).

It is important to note that ethnicity comparisons are based on projected estimates, since the Guam 2020 Census detailed tabulations have not yet become available.

For the entire pandemic total to date, by chronic conditions (Table 4), the proportion of cases with chronic conditions is low, and this reflects the younger population among COVID-19 cases, who tend to not (yet) have chronic conditions.

Hypertension, and current or former smoking are the only chronic conditions that are apparent among cases, but at proportions that are lower than estimates for Guam's overall population based on the CDC Behavioral Risk Factor Surveillance Survey.

Among COVID-19 related deaths, chronic conditions are readily apparent with hypertension (49.1%) and diabetes (45%) the most common, followed by cardiovascular disease (24.2%), and chronic renal (15.1%) or lung disease (8.9%). Overall, for the entire pandemic the proportion of deaths with any diagnosis of diabetes among deaths (MD notes, line list or death certificate) constitutes 53.3% (Table 15).

Regarding additional demographic indicators for COVID-19 related deaths, there is a continued pattern of high proportions with high school or less education dying from COVID-19.

By occupation, laborers, homemakers, managers and food service workers stand out as occupational risks among deaths.

By industry, construction, education, government, service/retail, homemaking, professional/management and food service also stand out among deaths.

The majority of the COVID-19 related deaths (Table 13) occurred in 2021 (43.8%), with 37.3% in 2020 and 18.9% in 2022, through March 14th. There were more DOAs in 2021 (50.5%), followed by 2022 (28%) with 21.5 % in 2020.
